MRI AND MRA EXAMINATION OF THE BRAIN:

TECHNIQUE:

· Sagittal T2WI

. Axial T2 and FLAIR WI

· Coronal T1WI

· 3D TOF MRA.

FINDINGS:

I- MRI:

· A well-defined intra-axial right thalamic hematoma seen displaying isointense signal in T1 and dark signal in T2 WI's denoting acute blood products signal (oxy-Hb). It measures about 24 x 27 mm in dimensions and showing intra-ventricular extension reaching the fourth ventricle.

" Left posterior temporo-parietal cortical/subcortical old infarction seen with CSF like signal and associated underlying gliotic tissues.

- Bilateral corona radiate and centrum semiovale old lacunar infarcts seen.

. Prominent cortical brain sulci with widened extra-axial CSF spaces and widened sylvian fissures.

· Voluminous supratentorial ventricular system with no hydrocephalic changes or deformity.

* Peri-ventricular deep white matter sheets and patches of high signal intensity in T2/FLAIR WI's seen denoting small vessels leukoencephalopathy.

- The cerebellum and brain stem are also normal.

· No extra axial collections.

MRA EXAMINATION OF THE BRAIN

TECHNIQUE:

· TOF MRA

FINDINGS:

11- MRA

· Absent horizontal segment of right AC. (NORMAL VARAINT)

* Patent normal caliber common carotid and both anterior and middle cerebral arteries. No evidence of stenotic segments, vessel occlusion or vascular malformation.

* Patent average caliber of the basilar and both posterior cerebral arteries with no evidence of vessei occlusion or stenotic segments.

OPINION:

- Unremarkable MRA studies of the brain.
