

Name: Mr. Abd Albaset Mohamed Attia
Age: 62 yrs
Referred by: Prof. Dr. Hossamaldeen Ali
Date of examination: 13 May 2024

Examination:

- Non-contrast Computed tomography of the chest and heart.

Findings:

- Right upper lobar tiny nodular discrete with tree-in-bud configuration and confluent opacities are noted mounting to consolidative patch.... *Likely reflecting infective pulmonary process... For clinico-lab correlation and follow up.*
 - Bilateral upper lobar apical fibrotic changes noted; likely sequel to old infective process.
 - Bilateral lower lobar posterior basal atelectatic plates also seen.
- Multiple tiny subcentimetric lucent lesions seen involving the dorsal spines. Expansible lucent lesion is noted involving the anterior aspect of the right 8th rib. Other multiple tiny lesions are seen also involving other ribs and sternum..... *Features are in favor of diffuse infiltrative marrow process; possibility of multiple myeloma considering patient's age is considered... For clinico-laboratory correlation.*
- Normal appearance of the tracheobronchial tree.
 - No evidence of hilar or mediastinal mass lesions or lymphadenopathy.
 - No evidence of pleural collections or thickening.
 - Normal cardiac size and shape, with no pericardial effusion.
 - Normal size and shape of the aorta and pulmonary trunk.
 - Bifid anterior aspect of the right 6th rib... Normal variant.
