[DATE]

MRT GSH
MRI TECHNIQUE:
+ Sagittal and| axial Tawi

+ Phase Contrast CSF flow study

FINDINGS!

I- MRI of the brain images:

Dilated Supratentorial ventricular system with no peri
ventricular trans ependymal [HOSPITAL] permeation.
Prominent Cortical biain|| sulci also seen with widened
extra-axial [LOCATION] ||

No cerebral areas of abnorinal signal.

II- [HOSPITAL] flow assessment:

Free flow of the [HOSPITAL] through the aqueduct of sylvius with
caudal flow noted during the systole (appears of low
signal) and cranial flow during the diastole (appears of
high signal).

II- Quantitative CSF flow assessment:

* Peak systolic velocity, [DATE]

* End diastolic velocity 9.72 cm/s

« Mean systolic velocity | 6.7 cm/s

* Mean systolic flux | 0.084 ml/s

* Duration of CSR systole | | 372 ms

« Stroke volume 31.91 ml

OPENTON:

elie ijedddienel le iayrpeentarnenamts| (Cen) NT [HOSPITAL] nT a
aqueduct of sylvius with negative study for norm:

pressure hydrocephalus,
