Hi

* Correlation done! to previous! MRI) study! dated 25-05 -2018, the current study shows | progr previously noted:

iM@ Course regarding the size of

* Well defined cystic! lesion /is) Seen in. the third ventricle currently measuring about | 2.3X92x2/4 'em | at maximum axial and cc dimensions. It shows intermediate signal on 11, bright signal on T2 and [HOSPITAL] with smooth lobular [NAME]. It shows central core Measures about 1.0/¢m of high SI in 11' low [HOSPITAL] in 12,

*. WEexerts @ mass effect pon foramina of [HOSPITAL] with resultant mild [NAME] of both lateral ventricle,

* Normal size and parehchymal signal intensity pattern of the cerebral hemispheres, cerebellum and brain stem.

* No shift of the midline structures,

* No extra-axial collections,

* Intact cranio-cervical junction,

UTIL

* Follow up status shows progressive course regarding previously noted |third Ventticle cystic lesion as above described likely colloid cyst for clinical correlation and follow up.

Much obliged
